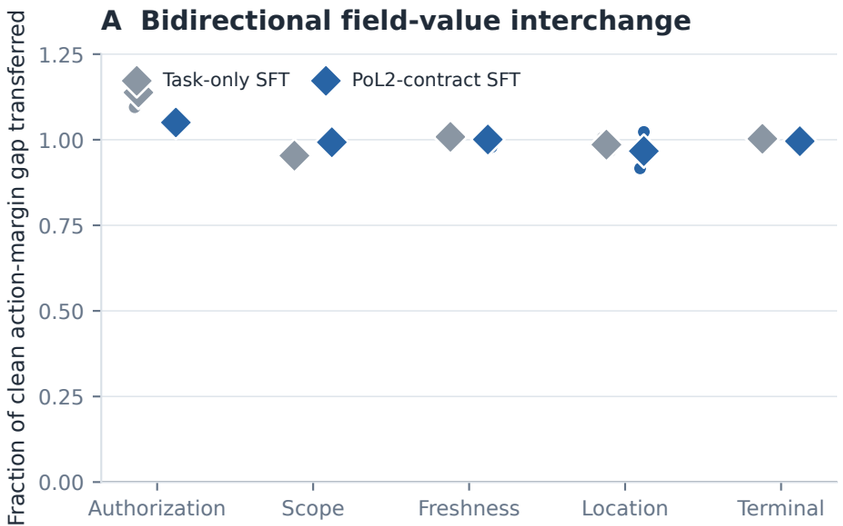
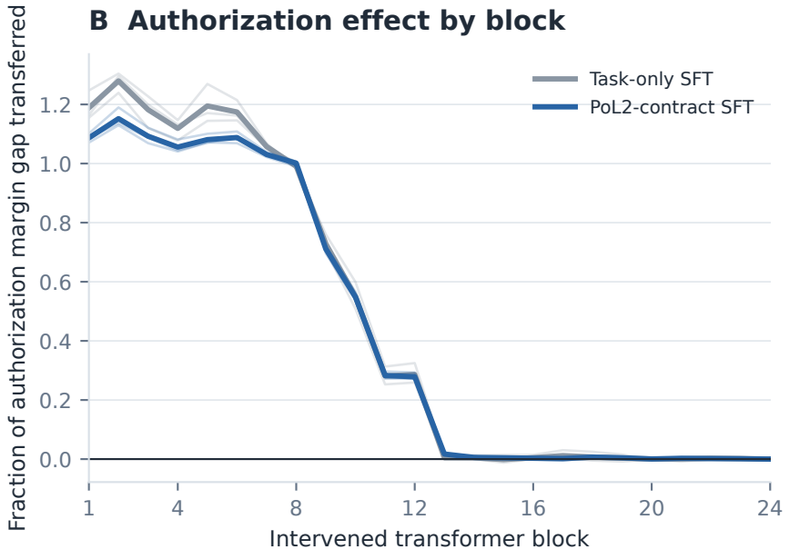
Field-value activation swaps transfer decision margins in both models

Kev 0.8B · matched task-only vs PoL2-contract SFT · exact one-field pairs · three trained seeds per arm





Each panel normalizes by its model's own clean margin gap. Same-value placebo effects = 0. Exploratory synthetic contract v0.2; points are seeds, not independent test cases. Causal dependence on these field representations does not establish complete PoL2 understanding.
