
1 Surface + reference
user input / assistant output / tool action
with the policy, instruction or prior turn it is judged against (G1)
2 Hard rules
authorisation scope enforced in code, not by a model
deterministic policy checks
3 Independent detectors
≥2 independently built: typed model + another family or a rule (G2, G6)
conforming / violating / insufficient + sufficiency question (G4)
neutral, swap-tested names (G3)
4 Local calibration
per-category thresholds fitted on held-out labelled data (G1, G4)
probabilities withheld; unneeded sensitive fields kept out; untrusted queries restricted, logged (G2)
5 Action
agree + confident: allow / repair / brief hold (final block needs a person; appeal)
else: clarify, or escalate with stated grounds (G6)
6 Human review
end of every chain that could block (G6, T4)
+ random audit of high-confidence automatic decisions
questioning (Art. 9) and audit outcomes update the calibration set
every step is recorded
7 Decision record → tamper-evident log; public copy delayed, coarsened (Art. 4, 5(5), 9(3); G5)
question, options and definitions · hash of input fields · probabilities · model, weights and calibration versions · rule or EAP clause cited as ground · written explanation · reviewer outcome
